CabineTrack™
Software

The CabineTrack™ software suite is scalable, flexible, and cost effective. Whether your application requires automated input using barcode technology or a complete enterprise RFID solution, CabineTrack™ is the answer. Based on a SQL architecture, CabineTrack™ delivers immediate value by communicating directly to a wide variety of business systems including SAP, Oracle, SQL and others.

CabineTrack™ is compatible with RFID, barcode, QR codes, and biometrics. It has the built-in ability to buffer data transactions in the event of a network communication failure.

Paired with our standard hardware, CabineTrack™ allows you to scale your solution:

Custom

All of the benefits of our entry and intermediate systems but then let us take it to the next level by letting our engineers work with you to fully integrate CabineTrack™ into your existing ERP or MRP system. Integration provides a robust solution that you control and that provides instant access into your processes from anywhere on the planet.

Intermediate

Everything from our entry solution plus, access data recorded from a number of CabineTrack™ devices using our hosted SAAS solution. This allows you to access data by accessing our cloud based solution.

Entry

Take your barcode solution to the next level by using CabineTrack™ with RFID to mimic a barcode scan. Trigger events like entering EPC data into a web form, triggering sensors or giving feedback via an LED display. This eliminates the human error factor of scanning bar codes manually—no skipping of codes, no questions about whether the code was read, and it adds the ability to track your product throughout the process.
